

## Deployment Plan

1

A data worksheet is completed identifying sites, groups, personnel, production areas, systems and network segments to be monitored.

2

GPA then pre-populates your account with the worksheet data, provisions GPA monitoring devices to your company and ships your devices.

3

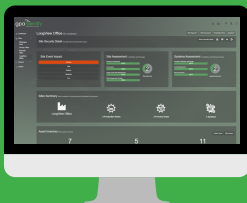

Your administrative users log in to GPA Identify and complete the site and system NIST standards cybersecurity assessment.

4

Monitoring devices are connected to network segments to begin passively discovering assets which are automatically populated in your account.

5

Once an accurate profile of your network assets are verified, reports can be generated, alert notification configurations made, and site/system monitoring is activated.
